

Motivation

The main factor in the success of MCMC methods is that they can be implemented with little efforts in a large variety of settings. Many softwares have been developed such as *WinBUGS* and *JAGS*, that helped to popularize Bayesian methods. These softwares allow the user to define his statistical model in a so-called BUGS language, then runs MCMC algorithms as a black box.

Although SMC methods have become a very popular class of numerical methods over the last 20 years, there is no such "black box software" for this class of methods. The *BiiPS* software aims at bridging this gap. From a graphical model defined in BUGS language, it automatically implements SMC algorithms and provides summaries of the posterior distributions.

SMC/particle methods

- ▶ Based on interacting particles systems governed by two stochastic mechanisms:
 1. Mutation/Importance sampling: particles explore the space randomly and independently
 2. Selection/Resampling: the best suited particles are duplicated, others removed
- ▶ Designed to sample from a sequence of distributions $\pi_k(x_{1:k}) = p(x_{1:k}|y_{1:k})$ when we can only compute the unnormalized version $\gamma_k(x_{1:k})$

$$\pi_k(x_{1:k}) = \frac{p(x_{1:k}, y_{1:k})}{p(y_{1:k})} = \frac{\gamma_k(x_{1:k})}{Z_k}$$

Generic SMC algorithm with N particles

- ▶ At time 1: for $i = 1, \dots, N$
 - ▶ Sample $x_1^{(i)} \sim q_1(x_1)$
 - ▶ Compute unnormalized weights $w_1^{(i)} = \frac{\gamma_1(x_1^{(i)})}{q_1(x_1^{(i)})}$ and estimate marginal likelihood $\hat{Z}_1 = \sum_{i=1}^N w_1^{(i)}$
- ▶ At time $k = 2, \dots, T$: for $i = 1, \dots, N$
 - ▶ Resample $\{x_{k-1}^{(i)}, w_{k-1}^{(i)}\}$ and set $w_{k-1}^{(i)} = 1/N$
 - ▶ Sample $x_k^{(i)} \sim q_k(x_k|x_{1:k-1})$
 - ▶ Compute unnormalized weights $w_k^{(i)} = w_{k-1}^{(i)} \frac{\gamma_k(x_{1:k}^{(i)})}{\gamma_{k-1}(x_{1:k-1}^{(i)})q_k(x_k^{(i)}|x_{1:k-1}^{(i)})}$ and estimate marginal likelihood $\hat{Z}_k = \hat{Z}_{k-1} \sum_{i=1}^N w_k^{(i)}$

Software features

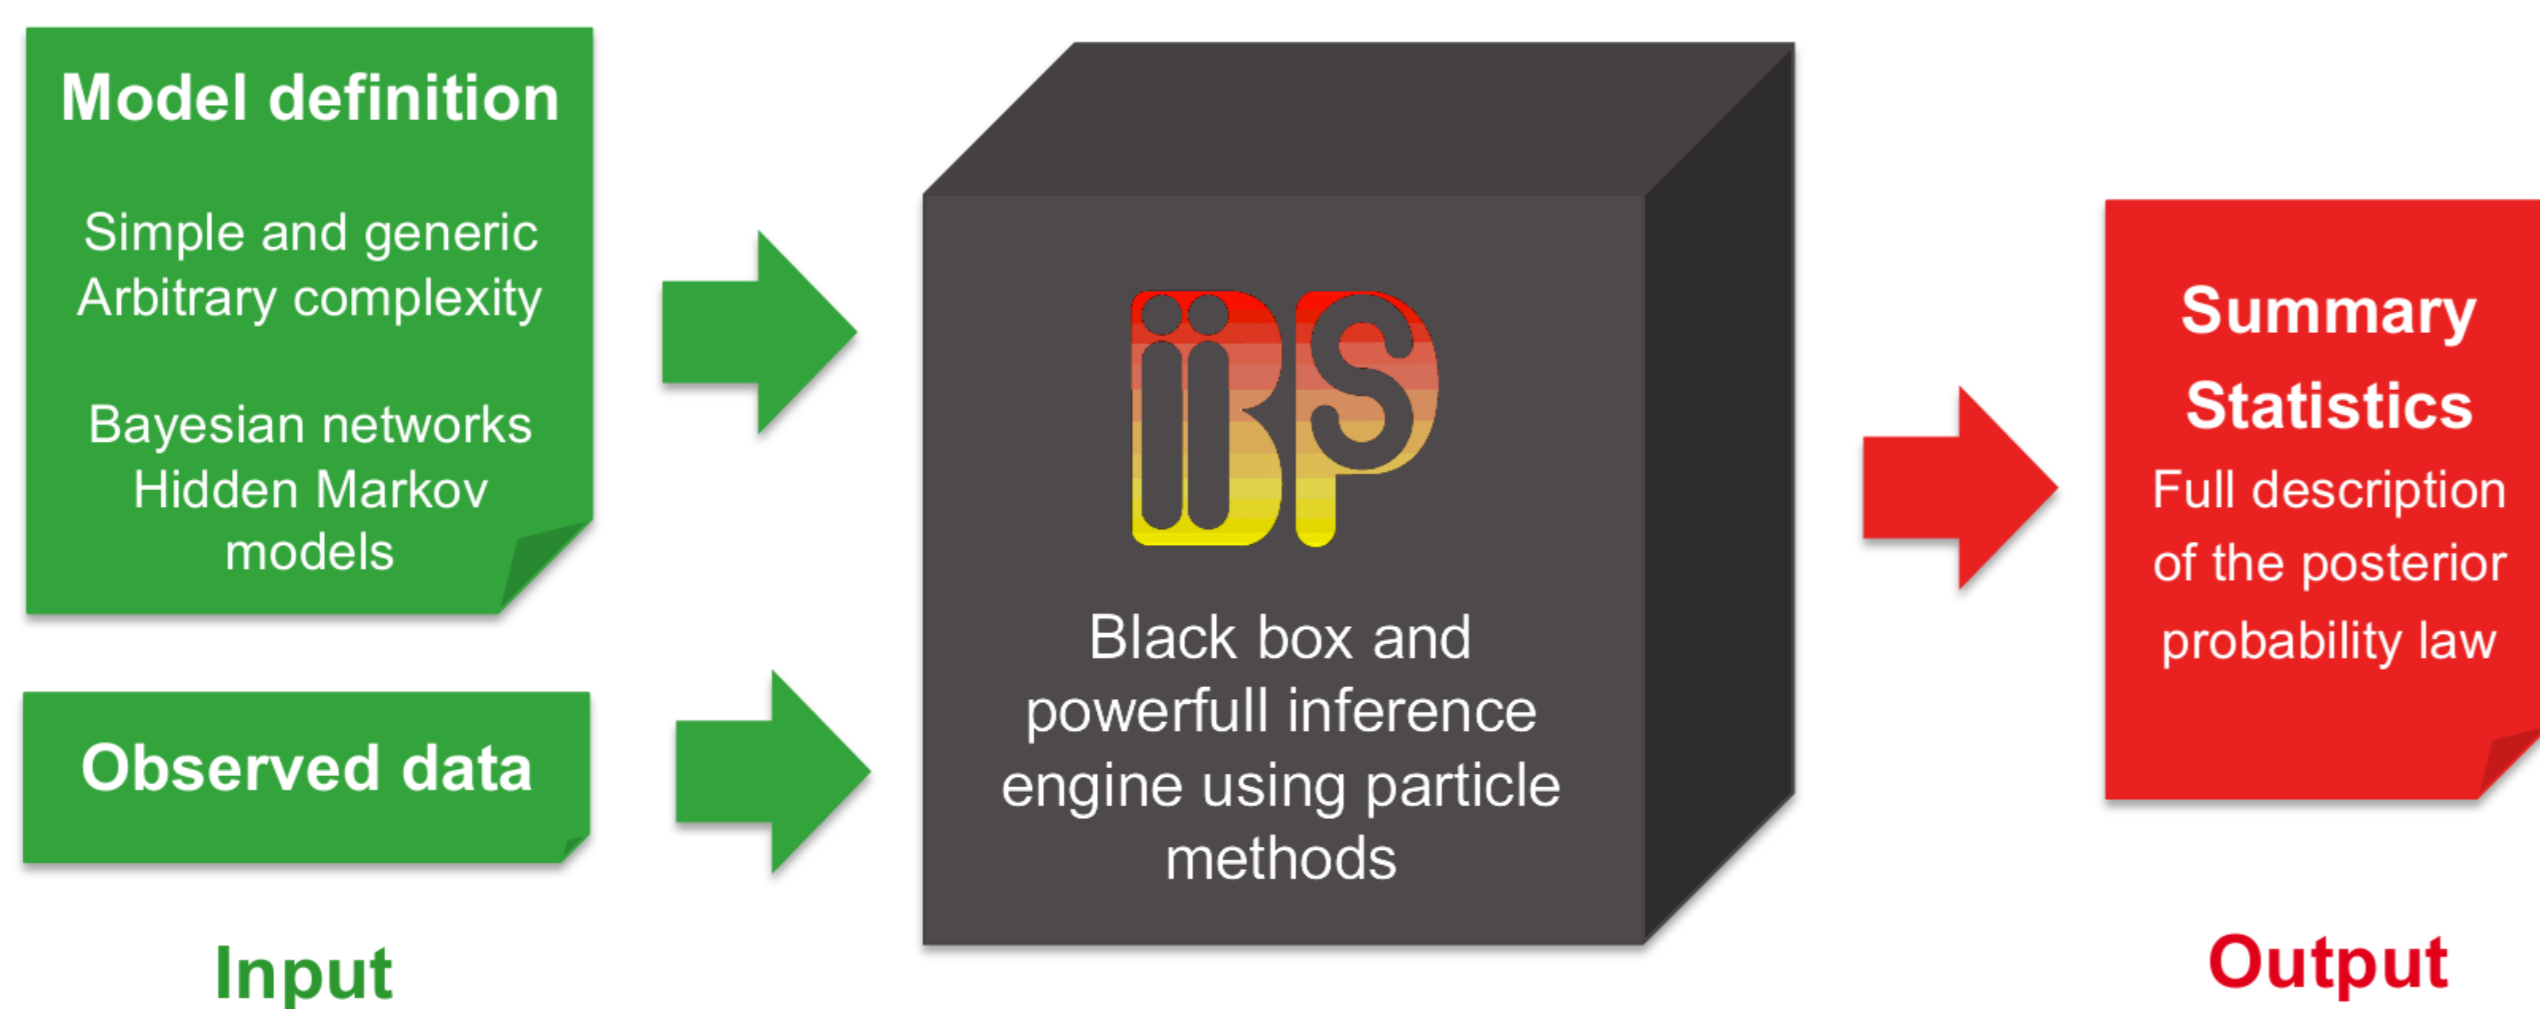

Figure : *BiiPS* input/output flowchart

BUGS language compatible

- ▶ Includes most usual uni/multivariate continuous/discrete distributions
- ▶ Standard operators, usual functions, matrix operations. . .
- ▶ Easy language extensions with R and Matlab functions

Development

- ▶ Free software adapted from *JAGS* © M. Plummer
- ▶ Core in C++ making use of Boost libraries
- ▶ Interfaces for and
- ▶ Multi-platform: Linux, Windows, Mac

SMC techniques

- ▶ Forward filtering
- ▶ Backward smoothing
- ▶ Usual resampling algorithms: multinomial, residual, stratified and systematic
- ▶ Conditional sampler for Gaussian conjugate prior

Particle MCMC techniques

- ▶ Particle Independent Metropolis Hastings
- ▶ Particle Marginal Metropolis Hastings with adaptive proposal

Example in financial econometrics

Consider inferring the underlying volatility $x_{1:t}$ from observed price or rate data $y_{1:t}$

$$\begin{aligned} x_1 &\sim \mathcal{N}(0, \frac{\sigma^2}{1-\alpha^2}) \\ x_t &\sim \mathcal{N}(\alpha x_{t-1}, \frac{\sigma^2}{1-\alpha^2}) \quad t > 1 \\ y_t &\sim \mathcal{N}(0, \beta^2 \exp(x_t)) \quad t > 1 \end{aligned}$$

BUGS language

```
alpha ~ dunif(0, 0.99)
prec.x <- (1-alpha^2) / sigma^2
x[1] ~ dnorm(0, prec.x)
for (t in 2:t.max) {
  f[t] <- alpha * x[t-1]
  x[t] ~ dnorm(f[t], prec.x)
  prec.y[t] <- 1 / (beta^2 * exp(x[t]))
  y[t] ~ dnorm(0, prec.y[t])
}
```

Figure : Hidden Markov Model

Figure : Volatility simulation

RBiiPS package

Inference of the volatility

```
data <- list(t.max=100, sigma=1.0,
            alpha=0.91, beta=0.5,
            y=y)
# Compile the model and load the data
model <- biips.model("volatility.bug",
                    data)
# Run SMC algorithm
out.smc <- smc.samples(model, "x",
                       n.part=1000)
# Summary statistics
x.summ <- summary(out.smc$x,
                  fun=c("mean","quantiles"),
                  probs=c(.05,.95))
plot(x.summ)
# Kernel density estimates
plot(density(out.smc$x, adjust=2))
```

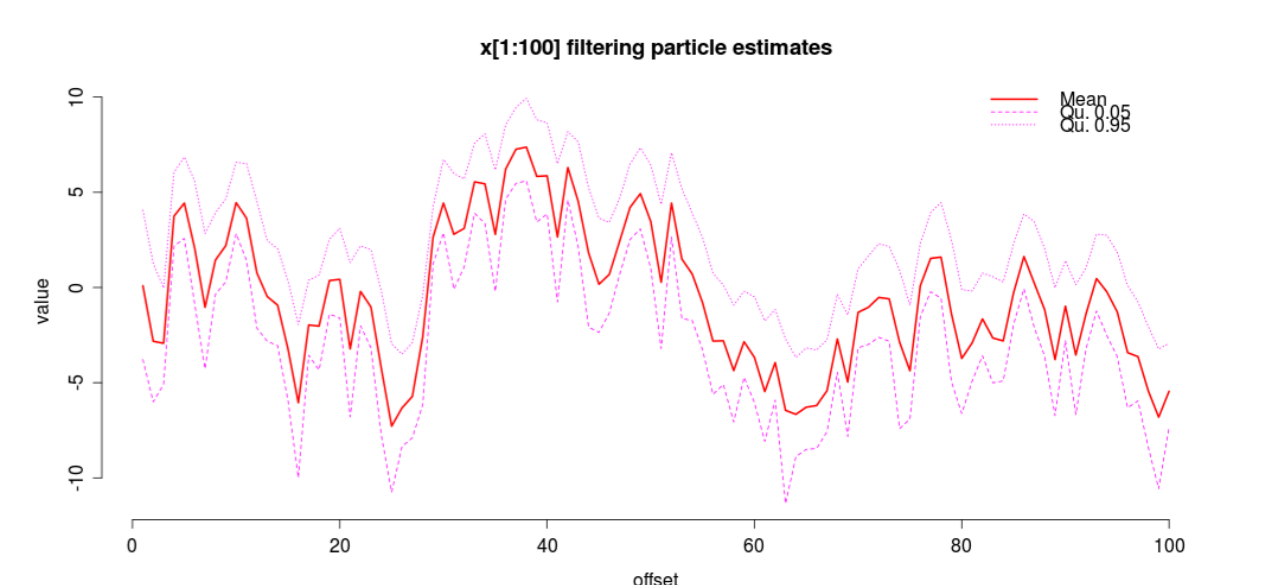

Figure : Summary statistics

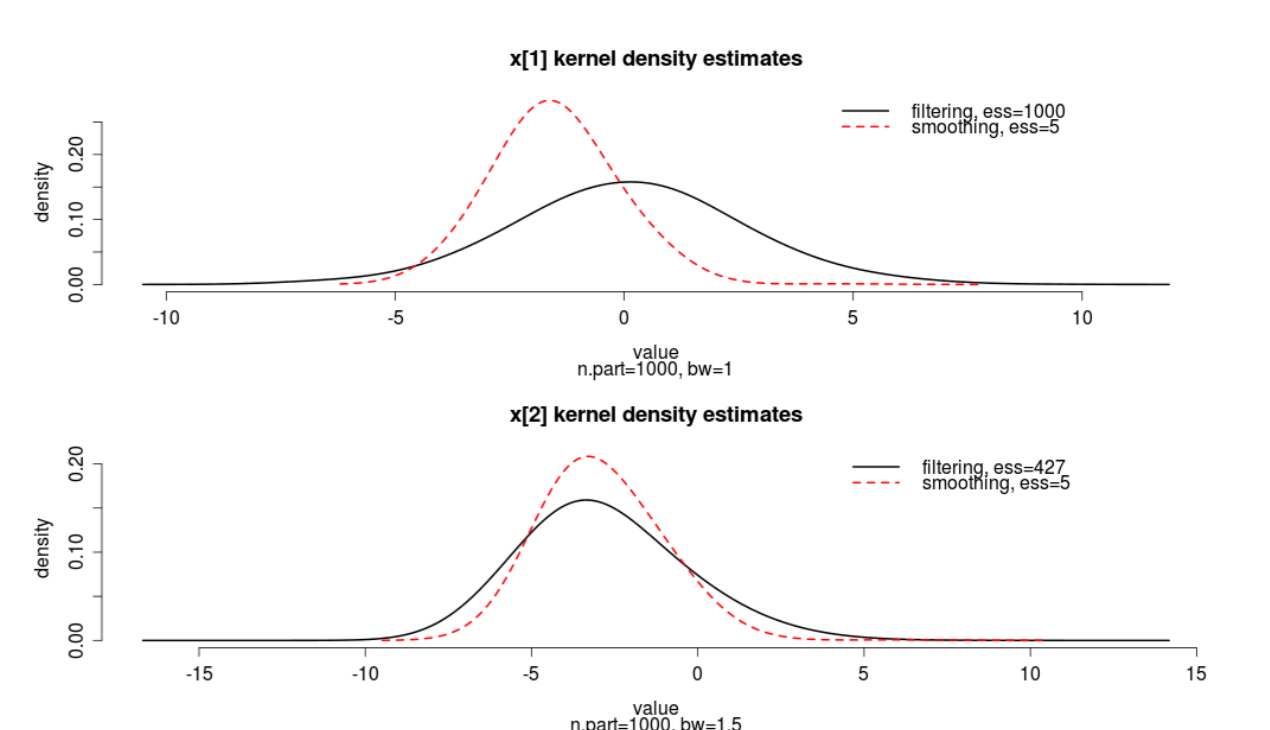

Figure : Kernel density estimates

Estimation of the fixed parameter α

```
data <- list(t.max=100, sigma=1.0,
            beta=0.5, y=y)
model <- biips.model("volatility.bug",
                    data)
# Sensitivity analysis
out.sens <- smc.sensitivity(model,
                           list(alpha=seq(0,.99,.01),
                           n.part=100)
plot(param$alpha,
     out.sens$log.marg.like)
# Burn in PMMH algorithm
update.pmmh(model, "alpha",
             n.iter=1000, n.part=100)
# Generate PMMH samples
out.pmmh <- pmmh.samples(model,
                          "alpha", n.iter=10000,
                          n.part=100)
# PMMH mean value
print(mean(out.pmmh$alpha))
# PMMH trace plot and histogram
plot(out.pmmh$alpha)
hist(out.pmmh$alpha)
```
